

MENU DRIVEN/SWITCH CASE/USER'S CHOICE PROGRAMS

Program 1:

/Write a java program to device a calculator which is capable of doing basic calculations

```
import java.util.*;//importing java package
class calculator//class declaration
{
public static void main(String args[])//method call
{

Scanner sc=new Scanner(System.in);

//initialising the variables
double n1,n2;
char ch;

System.out.println("Enter first number");//print statement
n1=sc.nextDouble();//taking the input
System.out.println("Enter second number");//print statement
n2=sc.nextDouble();//taking the input

//print statement

System.out.println(" Enter '+' for Addition,Enter '-' for Subtraction,Enter '*' for
Multiplication, Enter'/'for Division,Enter '%'for remainder");
System.out.println("Enter your choice");//print statement
ch=sc.next().charAt(0);//taking the input
double result;

result =0.0;
System.out.println("First number="+n1);//print statement
System.out.println("Second number="+n2);//print statement
switch (ch)//starting switch block
{
case '+'://first case for addition
result=n1+n2;

System.out.println("Addition of no.s="+result);//print statement
break;//applying break

case '-'://second case for subtraction
```

```

result=n1-n2;

System.out.println("Substraction of no.s="+result);//print statement
break;//applying break
case '*'://third case for multiplication
result=n1*n2;

System.out.println("Multiplication of no.s="+result);//print statement
break;//applying break

case '/'://fourth case for division
if (n2 ==0)//checking the conditon
    System.out.println("Division error");//print statement
else
    result=n1/n2;

System.out.println("Division of no.s="+result);//print statement
break;//applying break

case '%'://fifth case for remainder
if(n2==0)//checking condition
    System.out.println("Division error");//print statement
else
    result=n1%n2;

System.out.println("Result of modulus operator="+result);//print statement
break;//applying default

default://giving default

System.out.println("Invalid choice");//print statement
}
}
}
}

```

Program 2:

/*Program on The volume of solids, viz. cuboid, cylinder and cone can be calculated by the formula:

Volume of a cuboid ($v = l \times b \times h$)

Volume of a cylinder ($v = \pi r^2 h$)

Volume of a cone ($v = (1/3) \pi r^2 h$)

Using a switch case statement, write a program to find the volume of different solids by taking suitable variables and data types.

```
/*
import java.util.*;

public class Volume
{
    public static void main(String args[]) {
        Scanner in = new Scanner(System.in);
        System.out.println("1. Volume of cuboid");
        System.out.println("2. Volume of cylinder");
        System.out.println("3. Volume of cone");
        System.out.print("Enter your choice: ");
        int choice = in.nextInt();

        switch(choice) {
            case 1:
                System.out.print("Enter length of cuboid: ");
                double l = in.nextDouble();
                System.out.print("Enter breadth of cuboid: ");
                double b = in.nextDouble();
                System.out.print("Enter height of cuboid: ");
                double h = in.nextDouble();
                double vol = l * b * h;
                System.out.println("Volume of cuboid = " + vol);
                break;
            case 2:
                System.out.print("Enter radius of cylinder: ");
                double rCylinder = in.nextDouble();
                System.out.print("Enter height of cylinder: ");
                double hCylinder = in.nextDouble();
                double vCylinder = (22 / 7.0) * Math.pow(rCylinder, 2) * hCylinder;
                System.out.println("Volume of cylinder = " + vCylinder);
                break;
        }
    }
}
```

case 3:

```
        System.out.print("Enter radius of cone: ");
        double rCone = in.nextDouble();
        System.out.print("Enter height of cone: ");
        double hCone = in.nextDouble();
```

```

        double vCone = (1 / 3.0) * (22 / 7.0) * Math.pow(rCone, 2) * hCone;
        System.out.println("Volume of cone = " + vCone);
        break;

    default:
        System.out.println("Wrong choice! Please select from 1 or 2 or 3.");
    }
}
}
}

```

Program 3:

```

/*a program that displays the result of the following
evaluations based on the user's entry of choice from the keyboard
    Natural logarithm of a number
    Absolute value of a number
    Square root of a number
    Random number between 0 and 1
*/
import java.util.*;//importing java package
//class declaration
public class swi_m
{
//method declaration
public static void main(String args[])
{
Scanner sc=new Scanner(System.in);
//printing statement
System.out.println("****menu****");
System.out.println("1.Natural Logarithm");

System.out.println("The absolute value of the result is:"+m);
break;
case 3 :System.out.println("Enter a number whose square root is to be found");
int n2=sc.nextInt();
double m2=Math.sqrt(n2);
System.out.println("The square root of the result is:"+m2);
break;
case 4:double t=Math.random();
System.out.println(t);
break;
default :System.out.println("Invalid choice");
}
}
}

```

Program 4:

/*Using a switch case statement, write a menu driven program to convert a given temperature from Fahrenheit to Celsius and vice-versa. For an incorrect choice, an appropriate message should be displayed.

```

*/
import java.util.*;
class Temperature
{
public static void main(String args[])
{
    Scanner sc=new Scanner(System.in);
    double c,f, temperature; int conversion;
    System.out.println("enter temparature");
    temperature=sc.nextDouble();
    System.out.println("enter 1 for Celcius, 2 for Fahrenhite");
    System.out.println("Enter choice");
    conversion=sc.nextInt();
    switch(conversion)
    {
case 1:
c=5*(temperature-32)/9;

```

```

System.out.println("Temperature in Celsius = "+c);
break;
case 2:
f=1.8*temperature+32;
System.out.println("Temperature in Fahrenheit = "+f);
break;
default:
System.out.println("wrong choice");
}
}
}

```

Program 5:

**/*The Simple Interest (SI) and Compound Interest (CI) of a sum (P) for a given time (T)
* and rate (R) can be calculated as:**

$$(a) SI = (P * R * T) / 100 \quad (b) CI = P * ((1 + (R / 100))^T - 1)$$

Write a program to input sum, rate, time and type of Interest ('S' for Simple Interest and 'C' for Compound Interest). Calculate and display the sum and the interest earned.

```

*/
import java.util.*;

```

```

public class Interest_SI_Compound
{
    public static void main(String args[]) {
        Scanner in = new Scanner(System.in);
        System.out.print("Enter the sum: ");
        double p = in.nextDouble();
        System.out.print("Enter rate: ");
        double r = in.nextDouble();
        System.out.print("Enter time: ");
        int t = in.nextInt();
        System.out.println("Enter type of Interest");
        System.out.print("(S'- Simple Interest 'C'- Compound Interest): ");
        char ch = in.next().charAt(0);
        double interest = 0.0;

        switch (ch) {
            case 'S':

```

```

interest =( p * r * t) / 100;
double amt = p + interest;
System.out.println("Sum = " + p);
System.out.println("Interest = " + interest);
System.out.println("Amount = " + amt);
break;

case 'C':
interest = p * (Math.pow((1 + (r / 100)), t) - 1);
double amt1 = p + interest;
System.out.println("Sum = " + p);
System.out.println("Interest = " + interest);
System.out.println("Amount = " + amt1);
break;

default:

System.out.println("Incorrect Interest type");

}

}
}
}

```

Program 6:

**/*The equivalent resistance of series and parallel connections of two resistances are given by
* the formula:**

- (a) $R_1 = r_1 + r_2$ (Series)**
- (b) $R_2 = (r_1 * r_2) / (r_1 + r_2)$ (Parallel)**

Using a switch case statement, write a program to enter the value of r_1 and r_2 . Calculate and display the equivalent resistances accordingly.

```

*/
import java.util.Scanner;

public class Resistance
{
    public static void main(String args[]) {
        Scanner in = new Scanner(System.in);
        System.out.println("1. Series");

```

```

System.out.println("2. Parallel");

System.out.print("Enter your choice: ");
int ch = in.nextInt();
System.out.println("Enter r1: ");
double r1 = in.nextDouble();
System.out.println("Enter r2: ");
double r2 = in.nextDouble();
double eqr = 0.0;
switch (ch) {
    case 1:
        eqr = r1 + r2;
        System.out.println("Equivalent resistance = " + eqr);
        break;
    case 2:
        eqr = (r1 * r2) / (r1 + r2);
        System.out.println("Equivalent resistance = " + eqr);
        break;
    default:
        System.out.println("Incorrect choice");
}
}
}

```

Program 7:

/*A Mega Shop has different floors which display varieties of dresses as mentioned below:
Ground floor : Kids Wear
First floor : Ladies Wear
Second floor : Designer Sarees
Third Floor : Men's Wear
The user enters floor number and gets the information regarding different items of the Mega shop.
After shopping, the customer pays the amount at the billing counter and the shopkeeper prints the bill in the given format:

Name of the Shop: City Mart
Total Amount:

Visit Again!!

Write a program to perform the above task as per the user's choice.

```
/*
import java.util.*;

public class Shop_Mega
{
    public static void main(String args[]) {
        Scanner in = new Scanner(System.in);
        System.out.println("1. Ground floor");
        System.out.println("2. First floor");
        System.out.println("3. Second floor");
        System.out.println("4. Third floor");

        System.out.print("Select a floor: ");
        int f = in.nextInt();double amt=0.0;
switch (f) {
    case 1:
        System.out.print("Enter bill amount: ");
